

The model of innovative activity in US companies of IT sector

Speaker

Teplykh G.V.
Research fellow

- Цель
- Что мы знаем об инновациях?
- Обзор
- Основные источники вдохновения
 - Innovation capital as factor in PF
 - Knowledge creation as gradual process
 - Неопределённость инноваций, запас знаний как «пул идей» для генерации прорывных новинок
 - Ненаблюдаемые цены + FDS
 - Absorptive capacity concept

Firms' optimization problem

Firm problem

$$\max V_t = E_t \left\{ \begin{aligned} & (1 - \tau_t) \pi_t(X) + \tau_t \hat{\delta}_t \hat{K}_{t-1} - p_t^I [I_t + i_1(K_t - K_{t-1})^2 + i_2 I_t \mathbb{I}_{I_t < 0}] + \\ & + (B_t - B_{t-1}) - (o_0 + o_1 O_t + o_2 O_t^2) \mathbb{I}_{O_t > 0} + \beta_t V_{t+1} \end{aligned} \right\}$$

s.t. (liquidity condition)

$$\begin{aligned} CS_t = & CS_{t-1} + (1 - \tau_t) \pi_t(X) + \tau_t \hat{\delta}_t \hat{K}_{t-1} - p_t^I [I_t + i_1(K_t - K_{t-1})^2 + i_2 I_t \mathbb{I}_{I_t < 0}] \\ & + (B_t - B_{t-1}) + O_t \geq 0 \end{aligned}$$

$$M_t, L_t, R_t, K_t, Y_t, P_t, B_t, O_t, A_t, CS_t \geq 0, \omega_t \in [0; 1]$$

$(1 - \tau_t) \pi_t(X)$ – book profit after taxes

$\tau_t \hat{\delta}_t \hat{K}_{t-1}$ – depreciation allowance

$p_t^I [I_t + i_1(K_t - K_{t-1})^2 + i_2 I_t \mathbb{I}_{I_t < 0}]$ – cash flow from investing activity (CFI)

$(B_t - B_{t-1})$ – increase in corporate debt

$(o_0 + o_1 O_t + o_2 O_t^2) \mathbb{I}_{O_t > 0}$ – private quadratic costs of equity holders connected with external equity financing O_t .

Firms' optimization problem

$$\pi_t(X) = P_t(X)Y_t(X) - p_t^M M_t - p_t^L L_t - p_t^R R_t - \hat{\delta}_t \hat{K}_{t-1} - r_t(X)B_{t-1} - A_t$$

$P_t(X)Y_t(X)$ – total firm sales

$P_t(X)$ – price level of goods sold

$Y_t(X)$ – quantity index of goods sold. IT companies produce a variety of heterogeneous products and we don't know the structure of their turnover.

$p_t^M M_t$ – nominal material costs

$p_t^L L_t$ – nominal labour costs

$p_t^R R_t$ – nominal investment in R&D

A_t – advertising costs.

Price indices $p_t^M, p_t^L, p_t^R, p_t^I$ are assumed to be exogenous.

We distinguish between
nominal \hat{K}_t and real K_t capital.

$$\hat{K}_t = (1 - \hat{\delta}_t) \hat{K}_{t-1} + p_t^I I_t$$

The interest rate r_t may
vary reacting on firm-
specific liquidity risk.

$$E(r_{t+1}(X)) = r_0 + r_1 \frac{B_t}{V_t} + r_2 \frac{\pi_t}{Y_t} + FE \text{ (time, sector)}$$

Solution

- Решение оптимизационной задачи для фирмы – по факторам (FOC)
 - Насколько разрешима задача
- SMM – численное решение, какие моменты брать?
 - Производственная функция
 - Уравнение спроса на рынке
 - Спрос на факторы (factor demand system)
 - Основные показатели (V , B/K , I/K)
- Как выбирать начальные параметры и разброс сетки (или метод градиентов?)
